Allan B. Lewis

## **PRIORITY CLAIM**

15

This application claims priority from U.S. Provisional Application Ser. No. 60/448,938, filed February 21, 2003, which is hereby incorporated by reference.

## **FIELD OF THE INVENTION**

This invention relates to aircraft and, more specifically, to aircraft lavatories.

## **BACKGROUND OF THE INVENTION**

20

Lavatories, especially aircraft lavatories, provide a private space where users can perform daily functions or just freshen up. Many single occupant lavatories include a toilet and a sink. Thus, if a person just wants to brush their teeth or just freshen up they are occupying total lavatory time. As such, waiting times or queues may be present because the cycle time through the lavatories may be lengthy. Therefore, there exists a need to speed up  
25 cycles through the lavatories, thus shortening users' waits and reducing queues.

Also, many large commercial passenger planes include a 2-5-2 seat layout. Because of this layout, the depth of a lavatory is typically about 41" to ensure that aisle width meets regulatory compliance. However, in some recent large commercial passenger plane designs a 3-3-3 seat layout was introduced. These new designs include the lavatories designed for the 2-5-2 seat layout, thereby resulting in unused space between the lavatory and the aisle. Therefore, there is another unmet need to more efficiently use space allowable for a lavatory in a vehicle such as an aircraft.

#### **SUMMARY OF THE INVENTION**

The present invention relates to apparatus and methods for dual-purpose lavatory units. In one embodiment, a lavatory unit includes a first section, a second section, and a divider wall separating the first and second sections. The first section includes a commode and the second section includes at least one of a urinal and a sink.

The present invention may provide a more efficient use of space allotted to a lavatory unit within a vehicle or other structure, including an aircraft. In some embodiments, the present invention allows for faster cycle time through the lavatories by enabling people who don't have to use the toilet to be able to use a sink and mirror to freshen up. The present invention may also allow more seats to be added to a vehicle, because fewer lavatories may be needed due to the reduced cycle time.

#### **BRIEF DESCRIPTION OF THE DRAWINGS**

The preferred and alternative embodiments of the present invention are described in detail below with reference to the following drawings.

FIGURE 1 is a floor plan view of a first embodiment of the present invention;  
FIGURE 2 is a top elevational view of a second embodiment of the present invention;  
FIGURE 3 is a top elevational view of a third embodiment of the present invention;  
FIGURES 4-7 are perspective views of the embodiment shown in FIGURE 3; and

FIGURE 8 is a side elevational view of an aircraft 600 in accordance with another alternate embodiment of the present invention. .

### DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to apparatus and methods for providing more efficient use of lavatory space. Many specific details of certain embodiments of the invention are set forth in the following description and in FIGURES 1-8 to provide a thorough understanding of such embodiments. One skilled in the art, however, will understand that the present invention may have additional embodiments, or that the present invention may be practiced without several of the details described in the following description.

FIGURE 1 illustrates a top elevational view of an embodiment of a lavatory unit 100 (with a top or roof removed) in accordance with an embodiment of the invention. This embodiment may, for example, be used in aircraft with a 3-3-3 seat layout. The lavatory unit 100 may be used in aircraft with other cabin seat layout designs, in other vehicles (e.g. ships, buses, trains, subways, monorails, etc.), or as stand alone units. The lavatory unit 100 includes a first section 102 and a second section 104 that are separated by an interior wall 106. In this embodiment, the lavatory unit 100 is rectangular. The interior wall 106 is curved and is attached to adjacent exterior walls. The first section 102 suitably includes a commode 110 and a sink 112. A door 114 allows access to and from the first section 102. The commode 110 and the sink 112 are positioned to allow for optimum use of space and to provide occupant comfort.

The second section 104 includes a urinal 120 suitably positioned along the interior wall 106 that is concave towards the center of the second section 104. In a non-limiting example, a moveable curtain or door 122 is attached to a track between the interior wall 106 and an exterior wall 124. It will be appreciated that other closure devices can be used to provide privacy to an occupant of the second section 104, such as, without limitation, a hinged or folding door.

Embodiments of lavatory units in accordance with the present invention may provide significant advantages over the prior art. For example, cycle times through the lavatories may be greatly enhanced in comparison with the prior art lavatory. Persons wishing to use the sink 112 or the toilet 110 in the first section 102 may do so without preventing others  
5 from using the urinal 120 within the second section 104. Because the first and second sections 102, 104 are able to be used simultaneously, there may be decreased waiting times and shorter queues for persons wishing to use the lavatory. This may be particularly important in certain applications, including aircraft applications for which shorter queues and reduced waiting times may be important for a variety of reasons. Thus, the dual purpose  
10 lavatory unit may provide a superior facility in comparison with prior art lavatory facilities.

Furthermore, embodiments of lavatory units in accordance with the present invention may provide improved utilization of space within modern commercial aircraft. More specifically, for aircraft designs having a 3-3-3 seat layout, embodiments of lavatory units in accordance with the present invention may provide improved utilization of space between the  
15 lavatory and the aisle in comparison with prior art lavatory facilities.

An alternate embodiment of a toilet unit 190 is shown in FIGURE 2. The toilet unit 190 includes an arcuate or S-shaped wall 200 that separates a first section 202 from a second section 204 and is attached to opposing walls. The first section 202 includes a toilet 206, a toilet paper dispenser 210, and a wastebasket access door 214. The toilet paper  
20 dispenser 210 and the wastebasket access door 214 are positioned on the S-shaped wall 200 within reaching distance of the toilet 206 and are adjacent to a door 216. The wastebasket access door 214 provides access to a wastebasket cabinet 212 positioned behind the S-shaped wall 200.

The second section 204 includes a sink 224 attached to the S-shaped wall 200. An  
25 amenities cabinet 226 is positioned along the S-shaped wall 200 adjacent to the sink 224. A mirror 230 is mounted on the S-shaped wall 200 above the sink 224. A wastebasket access

door 234 is positioned on the wastebasket cabinet 212 between the S-shaped wall 200 and an exterior wall 240. A drinking fountain 244 and a cup dispenser 246 are located above the wastebasket cabinet 212. In one embodiment the drinking fountain 244 is accessible to users from outside of the second section 204.

5           The wastebasket cabinet 212 may include a foot-powered compactor 250. The foot-powered compactor 250 is operated by a foot pedal 252. Alternatively, the foot-powered compactor 250 may be an electrically powered compactor.

          As further shown in FIGURE 2, in this embodiment, a moveable curtain 258 is attached to an exterior wall 260 of the second section 204. The curtain 258 provides privacy  
10   to an occupant by sliding along a track or rail and connecting to the other exterior wall 240 that encloses the second section 204. It will be appreciated that other privacy devices can be used, such as, without limitation, a hinged or folding door. Various cabinets may be located in convenient locations within the first and second sections 202 and 204 as desired for a particular application.

15           It will be appreciated that the above-noted advantages may be achieved using alternate embodiments of the invention, including the embodiment described above and shown in FIGURE 2. Because the first and second sections 202, 204 are able to be used simultaneously, there may be decreased waiting times and shorter queues for persons wishing to use the lavatory. Persons needing to use only the sink 224 may do so without preventing  
20   other persons from using the toilet 206 in the first section 202. Also, because the lavatory unit 190 is divided into first and second sections 202, 204 by the arcuate wall 200, the lavatory unit 190 may provide improved utilization of space within modern commercial aircraft.

          FIGURES 3-7 illustrate a lavatory unit 280 in accordance with yet another  
25   embodiment of the invention. In this embodiment, the lavatory unit 280 includes a divider wall 286 that separates a first section 281 from a second section 320. The first section 281

includes a first sink 282 and a toilet 284. The first sink 282 is mounted to the divider wall 286 and a waste cabinet wall 288 that connects the divider wall 286 to an exterior wall 290. A waste cabinet door 292 is located above the first sink 282 on the waste cabinet wall 288 for allowing access to a waste cabinet 293. Amenities 296, a mirror 298, and a storage cabinet 300 are located above and behind the toilet 284. A folding, baby changing table 306 is mounted on an exterior wall 308 adjacent to the toilet 284. The baby changing table 306 stows in a vertical position. A toilet paper dispenser 310 is located adjacent to the baby changing table 306.

Referring to FIGURE 4, the second section 320 includes a second sink 322 with a motion controlled faucet 324. A mirror 326 is located above the faucet 324. A soap dispenser 330 and a sink light 332 are located under the mirror 326 and above the second sink 322. A floor light 338 is located below the second sink 322 for illuminating the floor of the second section 320. Storage and amenities cabinets 350 and 352 are located adjacent to both sides of the second sink 322. The storage and amenities cabinets 350 and 352 include storage for various amenities, such as, without limitation, lotions and tissues, and storage for sanitation items. The storage cabinet 300 located to the right of the second sink 322 when facing the second sink 322 includes a waste cabinet door 356 for providing access to the waste cabinet 293 (FIGURE 3).

FIGURES 5-7 are additional perspective views of the lavatory unit 280 shown in FIGURES 3 and 4, with portions of outer walls cut-away or removed to facilitate identification of interior components. Referring to FIGURE 6, the lavatory unit 280 may be positioned in an aircraft such that the exterior wall 308 of the first section 281 is formed to attach to or is positioned adjacent to a fuselage bulkhead 309 of the aircraft. In that case, the opening 321 of the second section 320 is adjacent to an aisle 323 of the aircraft. With regards to the lighting used within the embodiments of the present invention, U.S. Patent Application Ser. No. 10/097,944 is hereby incorporated by reference.

Again, it will be appreciated that the above-noted advantages may be achieved through alternate embodiments of the type described above with reference to FIGURES 3-7. Because the first and second sections 281, 320 are able to be used simultaneously, there may be decreased waiting times and shorter queues for persons wishing to use the lavatory unit 280, and the lavatory unit 280 may provide improved utilization of space within modern commercial aircraft.

Furthermore, it will be appreciated that a wide variety of apparatus may be conceived that include lavatory units in accordance with alternate embodiments of the present invention, and that the invention is not limited to the particular embodiments described above and shown in FIGURES 1-7. For example, FIGURE 8 is a side elevational view of an aircraft 600 having one or more lavatory units 602 formed in accordance with alternate embodiments of the present invention. In general, except for the lavatory units formed in accordance with the present invention, the various components and subsystems of the aircraft 600 may be of known construction and, for the sake of brevity, will not be described in detail herein. Embodiments of lavatory units 602 in accordance with the present invention, including but not limited to those embodiments described above and shown in FIGURES 1-7, may be constructed as a portable unit that is mountable in a vehicle, such as the aircraft 600.

More specifically, as shown in FIGURE 8, the aircraft 600 includes one or more propulsion units 604 coupled to a fuselage 605, wing assemblies 606 (or other lifting surfaces), a tail assembly 608, a landing assembly 610, a control system 612 (not visible), and a host of other systems and subsystems that enable proper operation of the aircraft 600. A plurality of lavatory units 602 formed in accordance with the present invention are located within the fuselage 605 and distributed throughout the various portions of the aircraft 600.

Although the aircraft 600 shown in FIGURE 8 is generally representative of a commercial passenger aircraft, including, for example, the 737, 747, 757, 767, 777, and 7E7

models commercially-available from The Boeing Company of Chicago, Illinois, the inventive apparatus and methods disclosed herein may also be employed in the assembly of virtually any other types of aircraft. More specifically, the teachings of the present invention may be applied to the manufacture and assembly of other passenger aircraft, cargo aircraft, rotary aircraft, and any other types of aircraft, including those described, for example, in The Illustrated Encyclopedia of Military Aircraft by Enzo Angelucci, published by Book Sales Publishers, September 2001, and in Jane's All the World's Aircraft published by Jane's Information Group of Coulsdon, Surrey, United Kingdom, which texts are incorporated herein by reference. It may also be appreciated that alternate embodiments of apparatus and methods in accordance with the present invention may be utilized in the other applications, including, for example, ships, buses, trains, recreational vehicles, subways, monorails, or any other desired application.

While preferred and alternate embodiments of the invention have been illustrated and described, as noted above, many changes can be made without departing from the spirit and scope of the invention. Accordingly, the scope of the invention is not limited by the disclosure of these preferred and alternate embodiments. Instead, the invention should be determined entirely by reference to the claims that follow.
